Dielectric Materials for Wireless Communication Mailadil T. Sebastian

Microwave dielectric materials play a key role in our global society with a wide range of applications, from terrestrial and satellite communication including software radio, GPS, and DBS TV to environmental monitoring via satellite.

A small ceramic component made from a dielectric material is fundamental to the operation of filters and oscillators in several microwave systems. In microwave communications, dielectric resonator filters are used to discriminate between wanted and unwanted signal frequencies in the transmitted and received signal.

When the wanted frequency is extracted and detected, it is necessary to maintain a strong signal. For clarity it is also critical that the wanted signal frequencies are not affected by seasonal temperature changes. In order to meet the specifications of current and future systems, improved or new microwave components based on dedicated dielectric materials and new designs are required. The recent progress in microwave telecommunication, satellite broadcasting and intelligent transport systems (ITS) has resulted in an increased demand for Dielectric Resonators (DRs). With the recent revolution in mobile phone and satellite communication systems using microwaves as the propagation media, the research and development in the field of device miniaturization has been a major challenge in contemporary Materials Science. In a mobile phone communication, the message is sent from a phone to the nearest base station, and then on via a series of base stations to the other phone. At the heart of each base station is the combiner/filter unit which has the job of receiving the messages, keeping them separate, amplifying the signals and sending them onto the next base station. For such a microwave circuit to work, part of it needs to resonate at the specific working frequency. The frequency determining component (resonator) used in such a high frequency device must satisfy certain criteria. The three important characteristics required for a dielectric resonator are (a) a high dielectric constant which facilitates miniaturization (b) a high quality factor (Q_{xf}) which improves the signal-to-noise ratio, (c) a low temperature coefficient of the resonant frequency which determines the stability of the transmitted frequency.

During the past 25 years scientists the world over have developed a large number of new materials (about 3000) or improved the properties of known materials. About 5000 papers have been published and more than 1000 patents filed in the area of dielectric resonators and related technologies. This book brings the data and science of these several useful materials together, which will be of immense benefit to researchers and engineers the world over.

The topics covered in the book includes factors affecting the dielectric properties, measurement of dielectric properties, important low loss dielectric material systems such as perovskites, tungsten bronze type materials, materials in BaO-TiO₂ system, (Zr,Sn)TiO₄, alumina, rutile, A_nB_{n-1}O_{3n} type materials, LTCC, ceramic-polymer composites etc. The book also has a data table listing all reported low loss dielectric materials with properties and references arranged in the order of increasing dielectric constant.

Key Features:

- collects together in one source data on all new materials used in wireless communication
- includes tabulated properties of all reported low loss dielectric materials
- in-depth treatment of dielectric resonator materials

From reader reviews:

Ann Wheeler:

Here thing why this specific Dielectric Materials for Wireless Communication are different and trustworthy to be yours. First of all examining a book is good however it depends in the content from it which is the content is as yummy as food or not. Dielectric Materials for Wireless Communication giving you information deeper and different ways, you can find any book out there but there is no book that similar with Dielectric Materials for Wireless Communication. It gives you thrill reading journey, its open up your eyes about the thing in which happened in the world which is might be can be happened around you. You can easily bring everywhere like in recreation area, café, or even in your method home by train. If you are having difficulties in bringing the imprinted book maybe the form of Dielectric Materials for Wireless Communication in e-book can be your substitute.

Dawn Campbell:

Information is provisions for folks to get better life, information nowadays can get by anyone on everywhere. The information can be a knowledge or any news even a problem. What people must be consider if those information which is from the former life are hard to be find than now is taking seriously which one would work to believe or which one the actual resource are convinced. If you obtain the unstable resource then you obtain it as your main information you will have huge disadvantage for you. All of those possibilities will not happen in you if you take Dielectric Materials for Wireless Communication as the daily resource information.

Glenn Remaley:

In this particular era which is the greater particular person or who has ability to do something more are more special than other. Do you want to become among it? It is just simple strategy to have that. What you are related is just spending your time little but quite enough to possess a look at some books. One of many books in the top listing in your reading list is Dielectric Materials for Wireless Communication. This book which can be qualified as The Hungry Mountains can get you closer in getting precious person. By looking upwards and review this publication you can get many advantages.

Trudy Clark:

What is your hobby? Have you heard which question when you got students? We believe that that problem was given by teacher for their students. Many kinds of hobby, Every individual has different hobby. And also you know that little person such as reading or as studying become their hobby. You need to know that reading is very important in addition to book as to be the thing. Book is important thing to incorporate you knowledge, except your own teacher or lecturer. You discover good news or update in relation to something by book. A substantial number of sorts of books that can you choose to adopt be your object. One of them is actually Dielectric Materials for Wireless Communication.
